Ticket No: 3

Summary Temporary Administrative Access Request – Industrial HMI Troubleshooting

Description

I am requesting temporary administrative access to the industrial HMI administration interface to investigate an authentication and connectivity issue reported by the operations team.

Initial troubleshooting indicates that the issue may involve account permissions or service configuration. I require access to review the administrative interface and verify the relevant configuration.

Business Justification:

The operations team requires restoration of reliable access to the HMI administration interface. Temporary access will allow IT to investigate the issue without granting permanent administrative privileges.

Requested Access Duration: 30 minutes

Requested Access: HMI administrative interface – troubleshooting only.

Requested Window: Tonight; ~30min

Security Considerations: No PLC logic changes, process-control modifications, or operational setpoint changes are included in this request. Any additional access requirements must be separately authorized.

Hi John,

I've received your request for temporary administrative access to the HMI administration interface.

I'll review the request and coordinate with the appropriate system owner and security team to confirm authorization. I'll update you once the access decision has been made.

Regards,
IT Support

Your temporary administrative access request has been approved by the SOC Administrator for a 30-minute window.

You may now proceed with the authorized HMI authentication and connectivity troubleshooting. This approval is limited to the stated troubleshooting activity and does not authorize PLC logic or process-control changes.

Access will expire automatically at the end of the approved window. IT Support will verify the access status and document the outcome before closing this ticket.

Paul L 22m ago

The authorized HMI authentication and connectivity troubleshooting access window has ended.

The SOC Administrator's approval was limited to 30 minutes. IT Support verified that access was initially successful and subsequently denied after the authorization expired. The SOC audit log also recorded the expiration event.

No PLC logic or process-control changes were authorized as part of this request.

The access request is now complete, and this ticket is being closed. Thank you.

JIT Access Review – Completion Notes

Associated JIT Request: JIT-88DDB8C8B88E
Related Spiceworks Ticket: #3
Resource: HMI Administrative Interface
Authorized Duration: 30 minutes
Decision: Approved by SOC Administrator

Actions and Verification:
- The SOC Administrator reviewed and approved the temporary access request.
- The requester successfully accessed the protected HMI interface during the authorized window (HTTP 200).
- After the 30-minute authorization period elapsed, a subsequent access attempt was denied (HTTP 403).
- The JIT gateway audit log recorded the access expiration with the reason `expired`.
- No manual revocation was performed; access ended through automatic expiration.

Security Outcome:

The time-limited access control operated as intended. The requester received temporary access for the approved troubleshooting activity, and authorization was automatically withdrawn when the approved window ended.

Disposition: Technical verification complete. No PLC logic or process-control changes were authorized. Ticket ready for closure by IT Support.
